

Respiratory Protection Training

In certain situations, employees may have to wear respiratory equipment to perform their job safely. This training course offers two types of training all of which are compliant to the requirements of NIOSH.

Gain a comprehensive overview of respiratory protection and industry standards, the types of equipment used along with various implementation strategies.

Learn how to interpret and comply with legislated respiratory protection regulations.

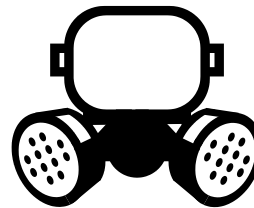

Not Product training!

It is important to differentiate between certified training and product training. Product training must be provided to users upon the introduction of new equipment.

The scope of Respiratory Protection as a concept is much more involving and requires total understanding.

There are two training programs which are both intensive and interactive. Participants are tested on the concepts learned. Successful participants receive certification.

Who should attend:

Workers. Employees who must perform work where they are required to use respiratory equipment. The law requires that a person be competent in order to perform their job safely.

Supervisors, Safety Officers & HR Personnel. Persons with the responsibility of supervising the use of Respiratory Protection equipment and procedures, must first understand the fundamentals. Proper understanding of the concepts learned will foster good planning and positive implementation.

Purchasers and Managers. Respiratory Protection does not always have to entail huge capital investments. Participants will learn down to earth good work practices and equipment selection.
